

Multiplying Square Roots

- Objectives:
1. to multiply a monomial numerical radical expression by another monomial numerical radical expression
 2. to multiply a monomial numerical radical expression by a binomial containing numerical radicals

Using the Product Property of Square Roots, we can multiply $\sqrt{2} \sqrt{3} = \sqrt{6}$

Since the number 6 does not contain any factor that is a perfect square other than “1,” this is simplified.

If we multiply $3\sqrt{6}$, we get $18\sqrt{6}$, which must then be simplified because 18 contains the factor 9, which is a perfect square. Continuing,

$$\begin{aligned} \sqrt{3} \sqrt{6} &= \sqrt{18} \\ &= \sqrt{9} \sqrt{2} \\ &= 3\sqrt{2} \end{aligned}$$

Example 1: $\sqrt{5} \sqrt{5} = \sqrt{25} = 5$ Also, keep in mind what a square root *is*. The square root of 5 is that number, which when multiplied by itself, yields 5. That is, $5 \cdot 5 = 25$. $\sqrt{5} \sqrt{5}$

Example 2: $\sqrt{6} \sqrt{15} = \sqrt{90}$
 $= \sqrt{9} \sqrt{10}$
 $= 3\sqrt{10}$

Example 3: $\sqrt{7} \sqrt{28} = \sqrt{196}$
 $= 14$

When we multiply a monomial times a polynomial, we distribute the monomial to each term in the polynomial. Therefore,

$$\begin{aligned} \sqrt{2}(\sqrt{3} + \sqrt{6}) &= \sqrt{2}\sqrt{3} + \sqrt{2}\sqrt{6} \\ &= \sqrt{6} + \sqrt{12} \\ &= \sqrt{6} + \sqrt{4} \sqrt{3} \\ &= \sqrt{6} + 2\sqrt{3} \end{aligned}$$

This is the simplified answer. Remember that you cannot add or subtract unlike radicals.

Example 4: $\sqrt{3}(\sqrt{21} + \sqrt{3}) = \sqrt{3}\sqrt{21} + \sqrt{3}\sqrt{3}$
 $= \sqrt{63} + \sqrt{9}$
 $= \sqrt{9}\sqrt{7} + \sqrt{9}$
 $= 3\sqrt{7} + 3$

Example 5: $\sqrt{2}(\sqrt{2} - \sqrt{5}) = \sqrt{2}\sqrt{2} - \sqrt{2}\sqrt{5}$
 $= \sqrt{4} - \sqrt{10}$
 $= 2 - \sqrt{10}$

Example 6: $\sqrt{3}(\sqrt{27} - \sqrt{12}) = \sqrt{3}\sqrt{27} - \sqrt{3}\sqrt{12}$
 $= \sqrt{81} - \sqrt{36}$
 $= 9 - 6$
 $= 3$
